1. Introduction

Bubylift is a free app for logging workouts, tracking progress and looking after your body. It runs in the phone browser and installs like any other app, with no app store. It is made for people who want to train with order: from someone starting today to someone already following a strength program or preparing for a military fitness test.

What you can do with the app

- **Get a plan made for you** from your goal, experience, days, equipment and injuries, with the reason behind every choice.
- **Log every set** with weight and reps, see what you did last time and get a suggested weight for today.
- **Choose how to train**: routines by muscle group, famous splits, classic programs, timed challenges or your own workout.
- **Look after your mobility** with stretching sessions and 13 phased Recovery plans for common aches.
- **See your progress**: charts per exercise, history, streaks, goals and your weight and measurement trends.
- **Take your account to any phone** with Google or e-mail and password. Your data syncs by itself.

Key facts

Item	Detail
Manual version	Bubylift 1.0
Languages	Spanish and English (switch in one tap)
Works offline	Yes. After the first load everything works without a connection; internet is only needed to sync, check for updates and send feedback
Exercises	About 1,000 exercises with English and Spanish names and technique guides
Units	lb·in·mi or kg·cm·km
Screens	Designed for phones; also adapts to tablets and computers
Price	Free, no ads
Author	Mike (@bubylifts)

Important notice. Bubylift is a logging tool and a general guide. It is not medical advice and does not replace a coach. If you have pain, an injury or a health condition, check with a doctor or physical therapist before training.

2. Installation and first start

Bubylift is not in an app store. You open it from a link and install it from the browser. Once installed it opens like any other app and works offline.

App address: **bubymed.github.io/bubylift**

iPhone (Safari)

1. Open the link in **Safari**, not inside Instagram or another app.
2. Tap the **Share** button (the square with the arrow pointing up).
3. Choose **Add to Home Screen** and confirm.
4. Open Bubylift from the new icon. Always use that icon to log your workouts.

> The installed app and Safari keep data separately. If you use an account, sign in on the installed app and everything appears there.

Android (Chrome)

1. Open the link in **Chrome**.
2. Tap the **Install** button at the top right, or the ⋮ menu and then **Install app**.
3. Open Bubylift from the icon added to your home screen.

Computer and tablet

Open the same link in the browser. On large screens the app uses two or three columns and a side menu. On desktop Chrome you can also install it from the install icon in the address bar.

Updates

The app updates itself when a new version is out and shows a **What's new** card once. If something looks outdated, go to **More → Check for updates**; the version number is shown there too.

First start

The first time you open the app you see the welcome screen with four options: **Continue with Google**, **Sign up**, **Log in** and **Continue as guest**. At the bottom you can switch the language between English and Español.

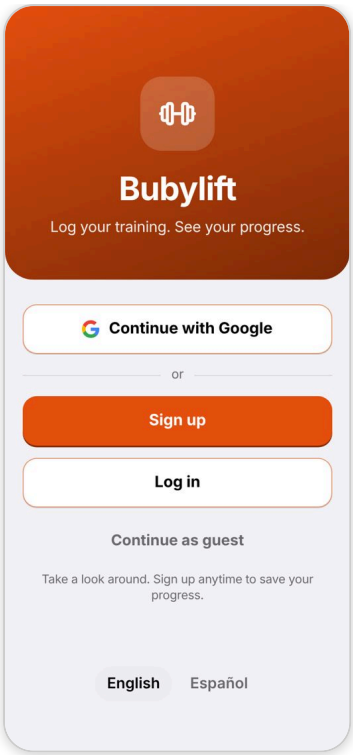

Figure 1. Welcome screen

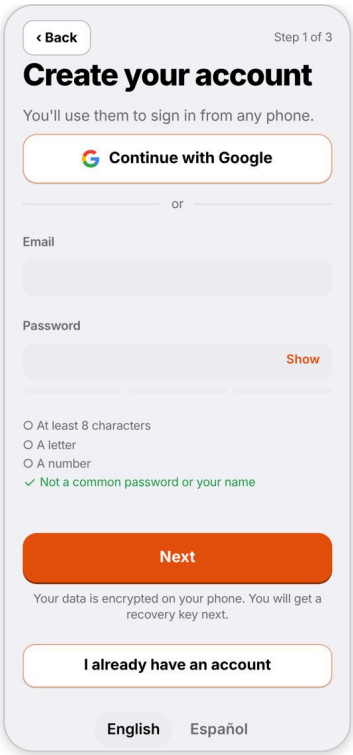

Figure 2. Create account, step 1

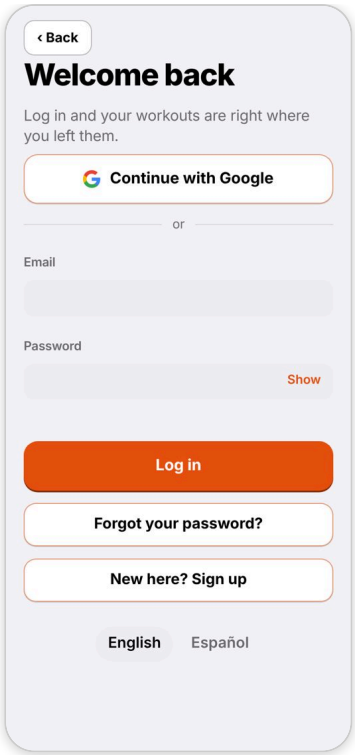

Figure 3. Log in

3. Account, guest mode and sync

You can use Bubylift in three ways. All of them give access to every feature; the difference is where your data is stored.

Mode	Where your data is stored	Best for
Guest	Only on this phone	Trying the app right away
Google	On this phone and in your account, with no password of its own	Signing in with one tap from any phone
E-mail and password	On this phone and in your account, encrypted on your phone	Maximum privacy

Continue as guest

Tap **Continue as guest** and you start instantly. While you are a guest you see a banner at the top with **Sign up** and **Log in** buttons. When you want to save your progress to the cloud, tap them: your current data moves into your account.

> ! As a guest your data lives only on this phone. If you clear browser data or lose the phone, it is gone. Create an account or export a backup now and then.

Continue with Google

Tap **Continue with Google**, pick your account and you are in. There is no password to remember. If you had signed in before with that account, your workouts, plan and settings appear by themselves. The button is on the welcome, sign-up and log-in screens.

> i If Google shows an "unverified app" screen, tap **Advanced** and then **Go to Bubylift**. The app only asks for your e-mail and name.

Sign up with e-mail and password

1. **Step 1.** Enter your e-mail and a password. The password needs at least 8 characters, a letter and a number, and cannot be a common password or your name. The checklist turns green as you type.
2. **Step 2.** Enter your name and pick a profile picture. A checkbox turns on the first-time guided tour.
3. **Step 3.** The app shows your **recovery key**. Keep it somewhere safe, for example a password manager, and tick the confirmation box.
4. When the account is ready you see "Account created!" and you enter the app. If your project requires e-mail confirmation, the app asks you to log in after you tap the link in the e-mail.

Recovery key. Your data is encrypted on your phone before it is uploaded; not even the app's creator can read it. That is why, if you forget your password, the recovery key is the only way to get your data back. The app cannot see it or reset it for you.

Log in

Enter your e-mail and password and tap **Log in**, or use **Continue with Google**. The **Forgot your password?** and **New here? Sign up** buttons are on the same screen.

If you created your account with Google it has no password: always sign in with the Google button. If you try e-mail and password you will see "e-mail or password doesn't match".

I forgot my password

1. On the log-in screen tap **Forgot your password?**.
2. Open the link that arrives in your e-mail; it brings you back to the app.
3. Choose a new password and enter your **recovery key** to keep your data.
4. If you lost the key you can **start fresh**: the app creates a new encrypted copy from the data on that phone.

Automatic sync

With an account you never sync by hand. The app saves your changes to the cloud a few seconds after you make them and when you open it. The account card at the top shows the status ("Synced 2 min ago").

Syncs	Stays on each device
Workouts and routines	Theme (light / dark)
Your plan and its progress	Language
Body measurements and goals	Notices you have already seen (tour, what's new)
Custom exercises	
Workout in progress	
Settings (units, rest, sound, equipment, text size)	
Recovery plan progress	
Profile name and picture	

> The workout you leave half-done travels with you too: start it on one phone and finish it on another. When you finish it, it disappears everywhere. When two copies differ, the latest change wins.

Profile and account menu

Tap your picture at the top right to open the profile menu: **Edit profile** (name and picture), **Switch profile** and **Delete profile**. If you are a guest, **Create my account** and **Log in** also appear. Under **More → Manage account** you can change your password, generate a new recovery key, sign out or delete your account.

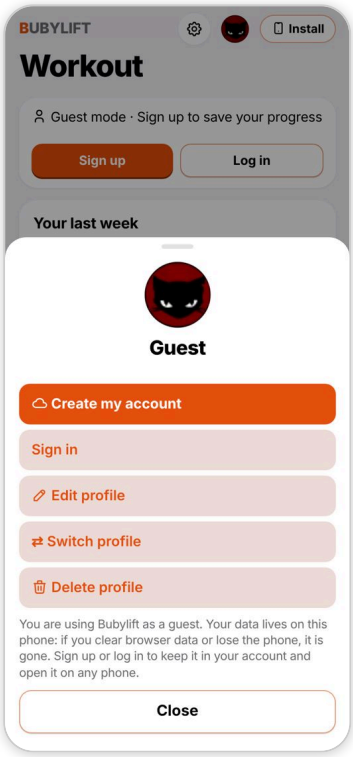

Figure 4. Profile menu (guest)

Privacy

- There are no ads and no tracking.
- As a guest, nothing leaves your phone.
- With an e-mail account your data is encrypted on your phone (AES-256) before it is uploaded; the server only stores ciphertext.
- With Google your data is stored in your account without extra encryption.
- The only optional thing that leaves the app is what you type in the feedback form, and only if you send it.

4. Guided tour

The first time you open the app, a tour of about 30 seconds walks you through the four tabs and the settings. Tap **Next** to move on or **Skip tour** to close it. On the last step, the **Finish tour** button closes it for good.

- You can turn it off when you create your account (step 2 checkbox) or under **More → Preferences → Quick tour**.
- You can replay it any time under **More → App → Replay the tour**.
- It does not show if you already have saved workouts.

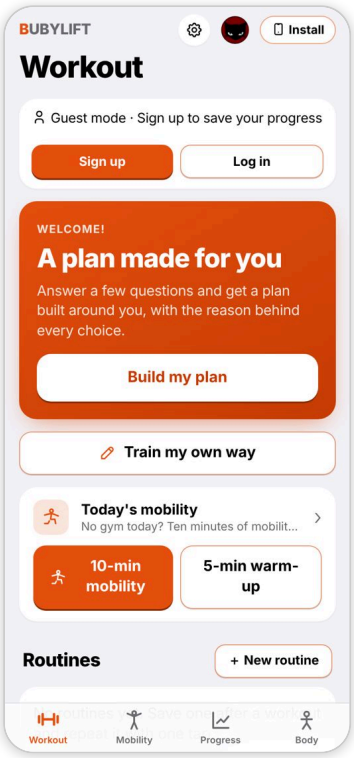

Figure 5. Tour step 1

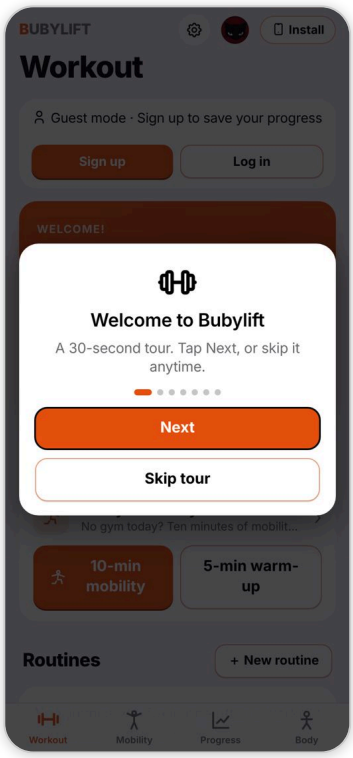

Figure 6. Tour step 2: the Workout tab

The navigation bar

Tab	What it is for
Workout	Your plan, starting a workout, routines and logging sets
Mobility	Stretching and warm-up sessions, body areas and Recovery plans
Progress	Summary, goals, charts per exercise and History
Body	Weight, body fat and measurements with their trend
Gear (top)	More: settings, your plan, your data, help and about

5. Workout tab

This is the main screen. From here you start any workout. What you see depends on whether you already have a plan.

No plan yet

You see an orange card titled **A plan made for you** with the **Build my plan** button. Below are the other ways to train: **Train my own way**, the **Today's mobility** card, your **Routines** and the **Explore** section.

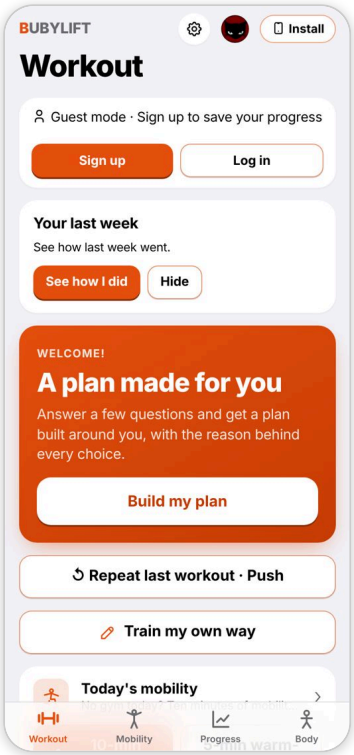

Figure 7. Screen with no plan

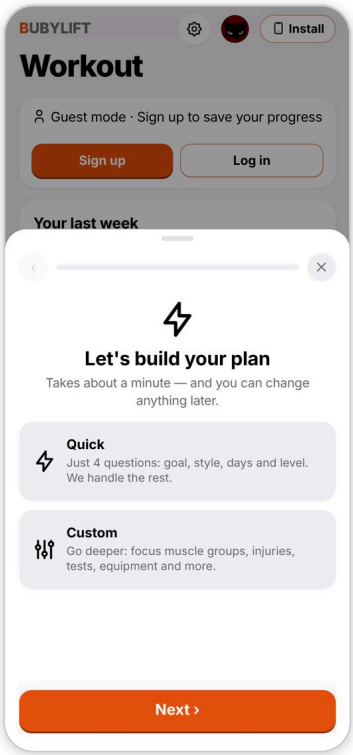

Figure 8. The plan wizard

Build your plan

Tap **Build my plan**. The wizard has two paths: **Quick** (just 4 questions: goal, style, days and level) or **Custom** (deeper: focus muscle groups, injuries, level tests, equipment and more). One question per screen; you can change everything later.

Question	Options
Goal	Build muscle · Get stronger · Lose fat · Stay fit · Hybrid athlete · Military fitness test · Runner · Bodybuilding
Style	Gym weights · Heavy strength · Calisthenics · Olympic lifting · CrossFit / functional · Athletic · Home / little equipment · Military / tactical (up to two)

Question	Options
Experience	Beginner · Some experience · Experienced
Days and length	How many days a week and how many minutes per session
Equipment	Full gym, home, dumbbells only, hotel or field; or tick item by item (barbell, dumbbells, cables, machines, kettlebell, bands, suspension, bench, pull-up bar…)
Injuries	Knee, low back, shoulder, elbow, wrist, hip, ankle / foot, neck: the plan avoids what aggravates them
Level test	Plank, balance, squat, push-ups, pulling and leg strength: your answers decide the starting phase
Emphasis	Balanced, lower body or upper body

The last screen is a summary. Tap **Create plan** and the app builds your week.

How the plan works (NASM OPT model)

The plan follows the NASM OPT model, with five phases of about four weeks each. Each session includes warm-up, activation (core and balance), skill development, resistance training and conditioning, depending on the phase.

Phase	Focus
1 · Base: control and endurance	Learn good movement and build stability with light weight and slow reps
2 · Strength with control	A strength exercise followed right away by a balance version of the same move
3 · Build muscle	More strength sets, usually one or two body parts per day
4 · Maximum strength	Heavy lifts, few reps and long rests
5 · Power	A heavy lift followed by a fast, explosive version

> Every day and every exercise has a **"Why…"**: the reason it was chosen. Tap "Why this plan is yours" at the top of the plan to read them.

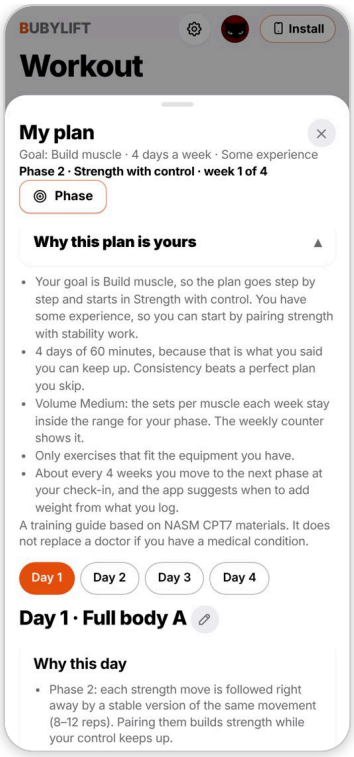

Figure 9. My plan: the reason for every decision

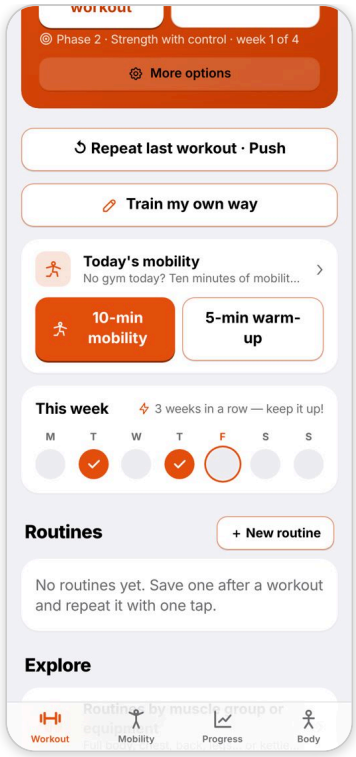

Figure 10. Your next training day

Training with your plan

With an active plan, the top shows the **Up next** card with today's day. Tap **Start workout** to load its exercises, or **See my full plan** to review the week. **More options** offers versions adapted to your situation, for example a shorter session, one that matches your energy, or a no-equipment mode.

Logging a workout

When you start, each exercise appears as a card with its photo, a suggested weight and a table of sets.

1. Enter the weight and reps of each set (with the − and + buttons or by tapping the number).
2. Tap the ✔ to mark the set as done. The rest timer starts.
3. If you need another set, tap **+ Add set**. The ✕ on a set clears it.
4. When all exercises are done, tap **Finish** at the top.

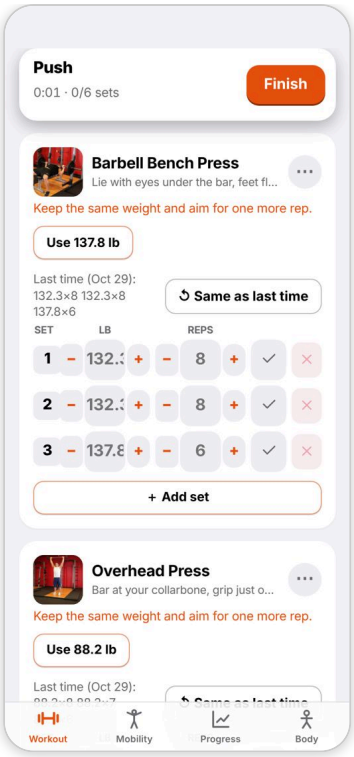

Figure 11. Workout in progress

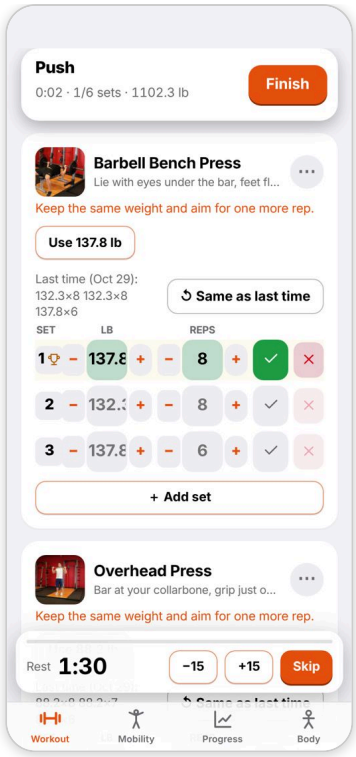

Figure 12. Logged sets and rest

Weight suggestions

Each exercise shows a suggestion line based on what you did last time:

- **First time:** pick a weight that leaves you about 3 reps to spare at the end of the range.
- **You reached the top of the range:** try the smallest step up.
- **You did not:** keep the weight and aim to complete all reps.
- **Several sessions without progress:** go a little lighter and focus on clean reps.

Two shortcuts save taps: **Use 137.8 lb** fills the empty sets with the suggested weight, and **Same as last time** copies the numbers from your previous session. You always decide what you lift.

Personal records

When a set beats your best estimated mark on that exercise, the row flashes gold with sparks, a 🏆 trophy appears and a notice tells you your new estimated max and how much it went up. If your phone has "reduce motion" on, the sparks are skipped.

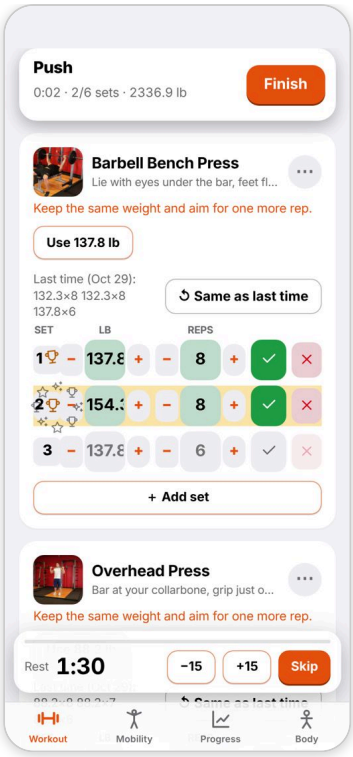

Figure 13. A personal record

Rest timer

When you mark a set, a bar at the bottom counts the rest. The **−15** and **+15** buttons adjust the time and **Skip** closes it. The default length and the sound are chosen in More. The sound may be silent on iPhone if the ringer is off, and vibration is not available on iPhone.

Each exercise menu (···)

Option	What it does
Swap	Replaces the exercise with an equivalent alternative
Guide	Opens the technique guide with steps and tips
Move down / up	Changes the exercise order
I like this	Marks the exercise as a favorite: the app will use it more when building plans
I don't like this	The app will avoid it when building plans
Remove last set	Deletes the last empty set
Remove exercise	Takes the exercise out of this workout

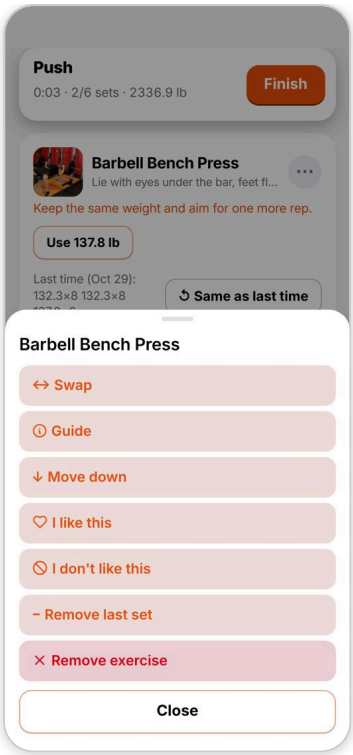

Figure 14. Exercise menu

Finishing and cancelling

Finish saves the workout to your history. If sets are left unmarked, the app warns you they will not be saved and lets you decide. When you finish you see a summary with duration, sets and total volume, and you can share it. You can also cancel a workout without saving it.

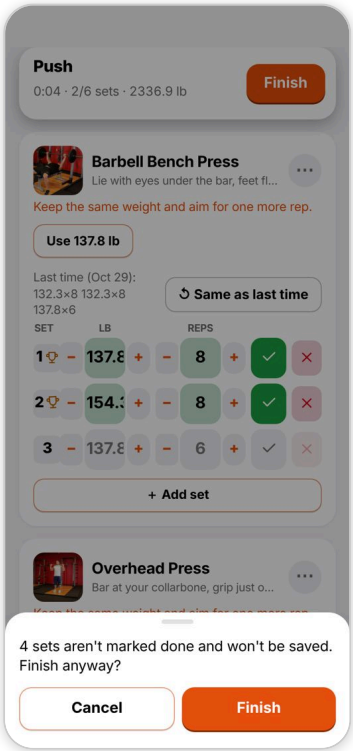

Figure 15. Confirm when finishing

6. Routines, exercises and ways to train

Train my own way

Start an empty workout and add the exercises you want with **+ Add exercise**. The search box and the muscle-group filters (Chest, Back, Shoulders…) help you find them; **Recent** ones appear first. If you cannot find an exercise, you can create a **custom** one.

There are three ways to log an exercise, depending on its type: **weight × reps**, **bodyweight reps** or **time and distance**.

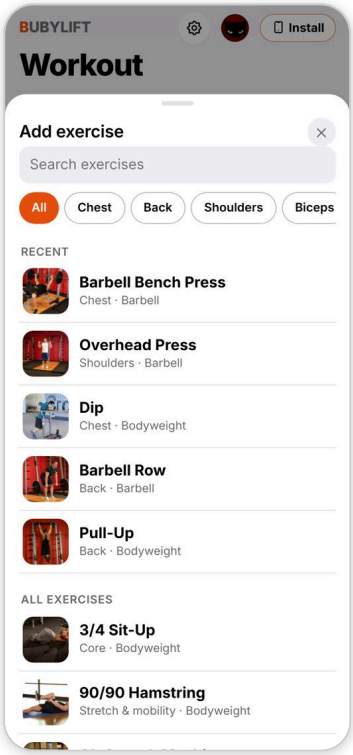

Figure 16. Add exercise

Repeat your last workout

The **Repeat last workout** button starts again with the same exercises and sets as your last session.

My routines

A routine is a list of exercises you repeat. Create one with **+ New routine** (name and exercises) or save any finished workout as a routine from History. Tap a routine to start it. Swipe a routine one way to **edit** it or the other way to **delete** it.

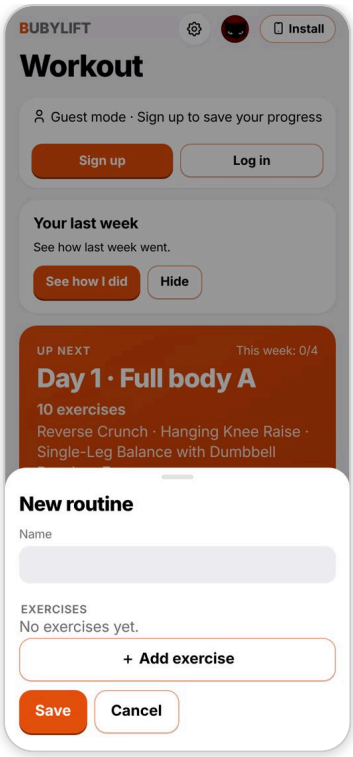

Figure 17. New routine

Explore: muscle groups, splits, programs and challenges

The **Explore** section opens a panel with four tabs. In all of them, **Equipment you have here** filters exercises to what you have at hand.

Muscle group or equipment

Pick a group (full body, chest, back, shoulders, arms, legs, glutes, core, stretching and mobility) or a piece of equipment, and a **rank** from 1 to 6. Each group has its own rank names; for chest, for example: Dove, Rooster, Bull, Gorilla, Bison and Mammoth. Higher ranks use more range of motion, single-side work, harder leverage and less momentum, and each exercise says which one it uses.

Rank	Sets and rest	Idea
1	3 sets, ~75 s	Stable moves, both sides together; you learn the pattern
2	4 sets, ~75 s	The same base with one more set
3	4 sets, ~90 s	Free weights, more range, one side at a time
4	5 sets, ~90 s	The same difficulty with one more set
5	Long rests	No momentum, hard leverage, unstable tools
6	Extra sets, short rests	Elite work: only after months of good technique

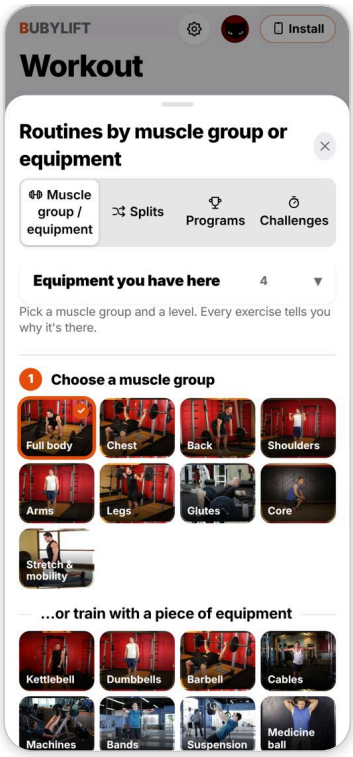

Figure 18. Routines by muscle group or equipment

Famous splits

Well-known structures built with your equipment: **Upper / Lower**, **Push / Pull / Legs**, **Arnold split**, **One muscle group per day** and **Upper/Lower + Push/Pull/Legs**. Train a day right away, save it as a routine or use the split as your plan.

Classic programs

Well-known programs built with your equipment. **5/3/1** calculates the weight of each set from your training max.

Program	Summary
Full body	3 A/B days, simple and complete
StrongLifts 5×5	3 A/B days, 5 sets of 5
Starting Strength	3 A/B days, 3 sets of 5
5/3/1 (Wendler)	4 days, one main lift per day, % of your max
PHUL	Power and hypertrophy, upper and lower
German Volume (10×10)	Ten sets of ten on the main lifts

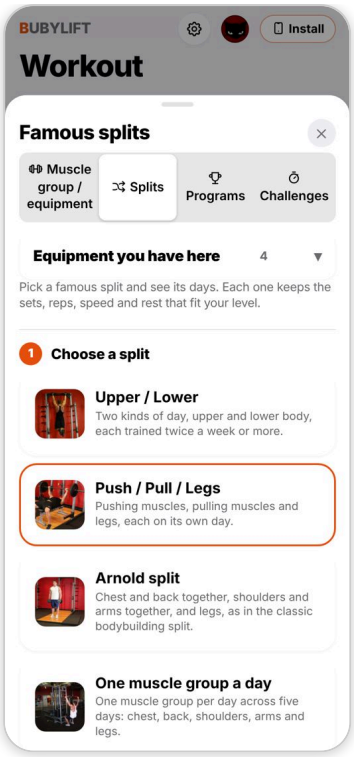

Figure 19. Famous splits

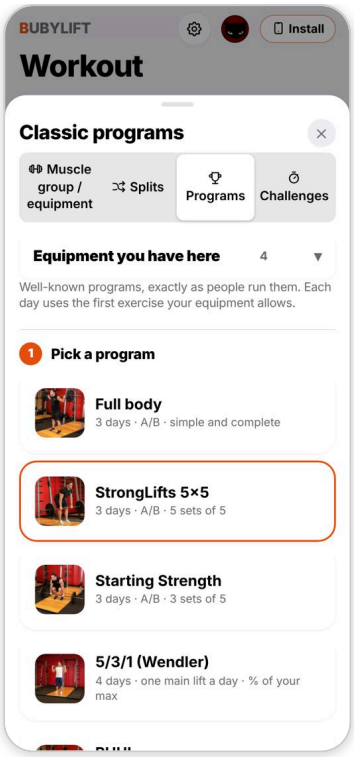

Figure 20. Classic programs

Challenges

30 sessions with a built-in timer: **Morning PT**, **CrossFit-style**, **Hyrox-style**, **Running**, **Military** and **No equipment**. The formats are **AMRAP** (as many rounds as you can), **EMOM** (every minute), **for time** and **intervals**. Mark your equipment and each challenge adapts; your best result is saved. Any routine or challenge can be added to your plan as an extra day.

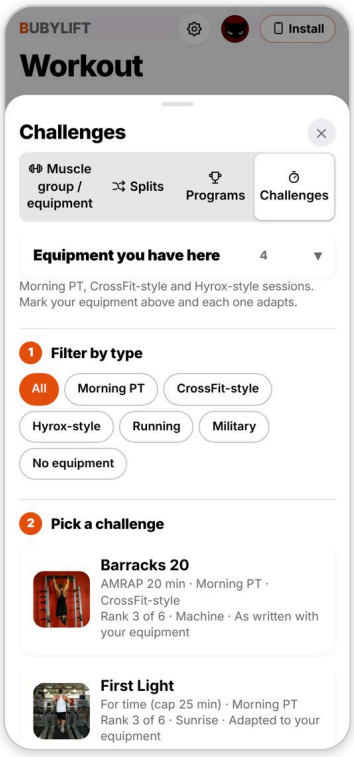

Figure 21. Challenges

7. Plan tools

When you have a plan, the **More → My plan** section gathers the tools to adjust it.

Tool	What it is for
Reminders	Add your training days to the phone calendar
Your tastes	List of exercises you like or prefer to avoid; the plan respects them
Weekly schedule	Choose which days you train
Weekly volume	Sets per muscle group versus the recommended range for your phase
AFT test	Only on military-test plans: your best result in each event, your target and the weakest event
See my full plan	Review or reorganize all days: move exercises, send them to another day or rename days

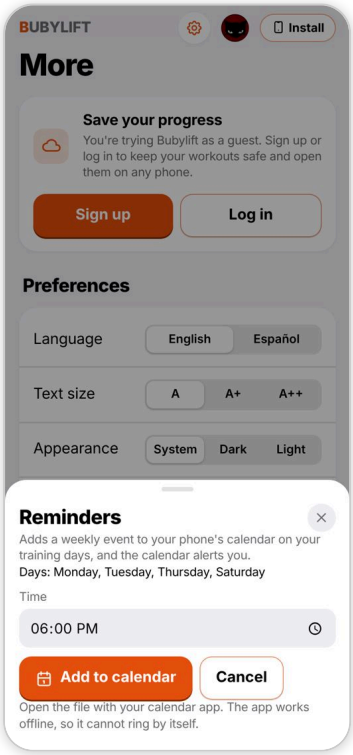

Figure 22. Reminders

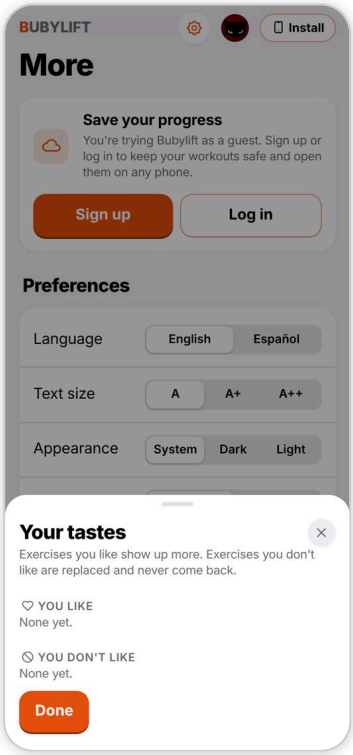

Figure 23. Your tastes

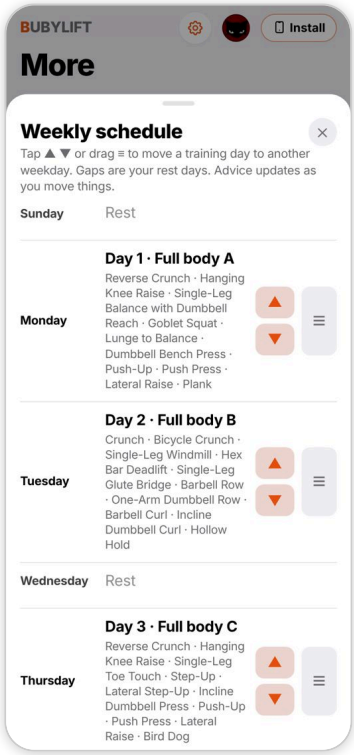

Figure 24. Weekly schedule

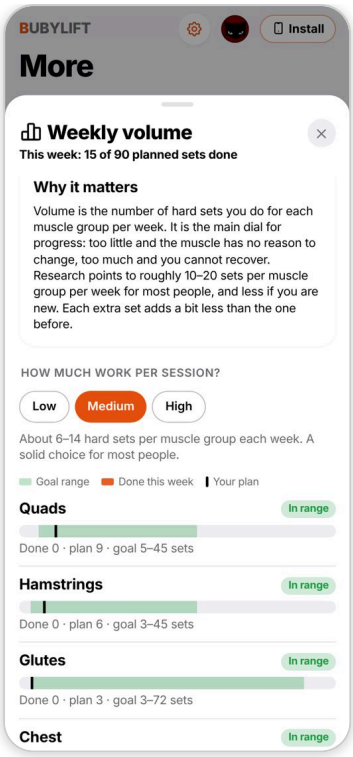

Figure 25. Weekly volume

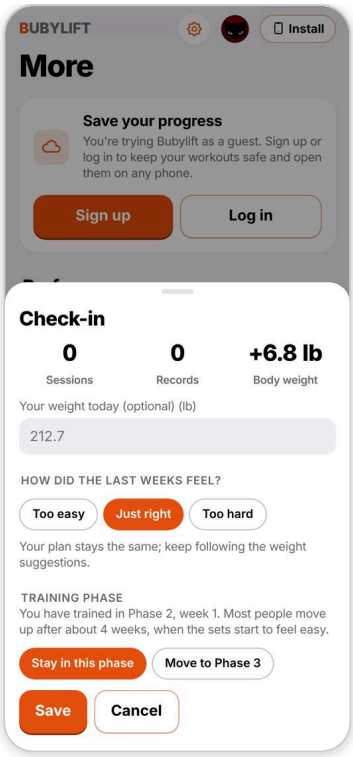

Figure 26. The periodic check-in

Periodic check-in

About every four weeks the app offers a check-in: you see how many sessions you did, how many records you set and how your weight changed. You say how the last weeks felt (**Too easy**, **Just right** or **Too hard**) and choose whether to stay in your phase or move to the next one. The app can also suggest changes: swap an exercise you skipped, swap one that is not progressing or lower the volume if you do not finish your sets.

8. Mobility tab

Stretching, warm-ups and Recovery plans. At the top, a card highlights **Today's mobility** with a button to start. Below are three sections: **Sessions**, **By area** and **Recovery**.

Sessions

Pick a focus (Full body, Lower body, Upper body, Back and core, Dynamic warm-up) and a length. The app builds a guided session with a timer for each move.

By area

Every stretch grouped by body area (hamstrings, hips and glutes, quads and hip flexors, chest, back, arms and wrists, and more), each with its guide.

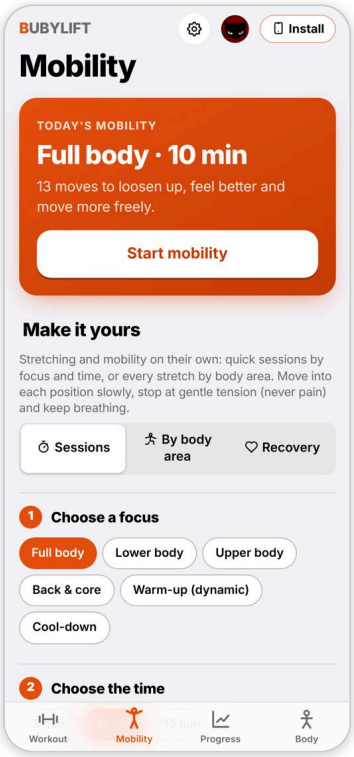

Figure 27. Mobility

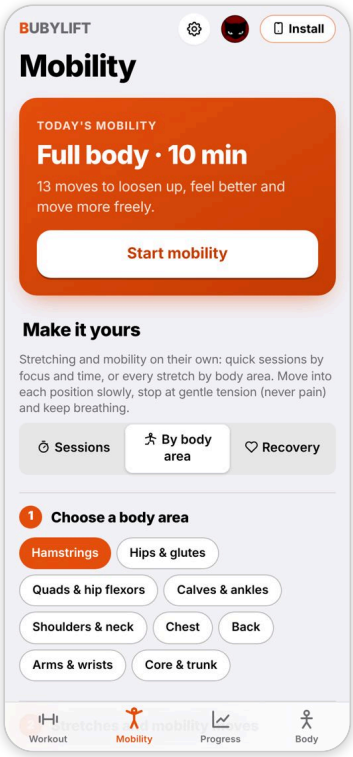

Figure 28. By body area

Recovery plans

Thirteen phased home programs for common aches. They are based on published clinical guidelines and rehabilitation protocols. Each plan explains the problem in plain language, summarizes the available evidence and cites its sources. Filter by area: Foot and ankle, Knee and shin, Hip and thigh, Back and neck, Shoulder and arm.

1. Open a plan and read the **safety check**. If you tick a warning sign, the plan is blocked and the app tells you to see a professional.
2. Tap **Start today**. You are on phase 1 of 4.

3. Each day log your pain (0 to 10) and tap **Start session**: a workout loads with your phase exercises.
4. When you meet the phase criteria, move up with **Next phase**. Your progress is saved and syncs with your account.

> Recovery plans are a general guide, not a diagnosis or a substitute for medical care. If the pain gets worse, appears suddenly, or comes with strong swelling, numbness or fever, stop training and see a professional.

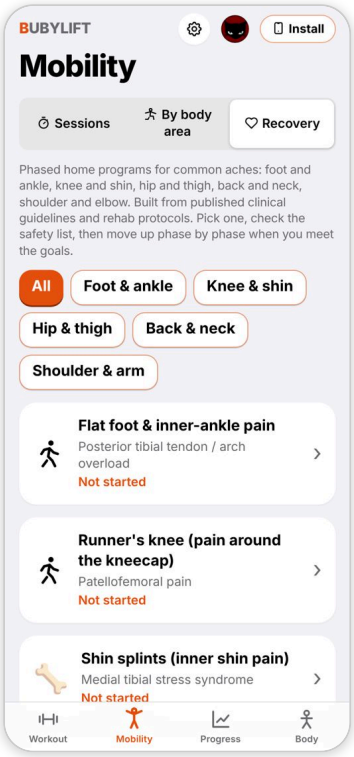

Figure 29. Recovery plans list

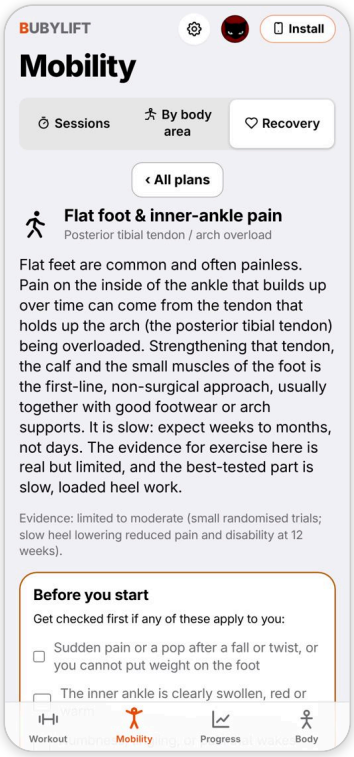

Figure 30. A Recovery plan

9. Progress tab

Progress gathers your summary, your goals, the per-exercise charts and the **History**. At the top is a switch with two views: **Progress** and **History**.

Summary, streak and goals

- Three figures: workouts **this week**, **this month** and **in total**.
- **Weekly streak:** consecutive weeks meeting your target. One missed week is forgiven.
- **Your last week:** a summary of how it went, from the Workout tab.

Your goals are concrete targets with a progress bar. Tap **Set a goal** and choose from four kinds:

- **More reps** in an exercise (for example, 10 pull-ups in a row).
- **Lift more weight** (for example, bench press of 225 lb).
- **Body weight:** reach the weight you want, up or down.
- **Train consistently:** workouts in the last 30 days.

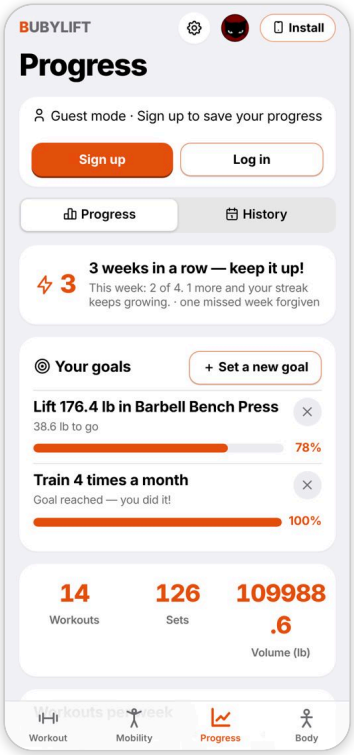

Figure 31. Progress: summary, streak and goals

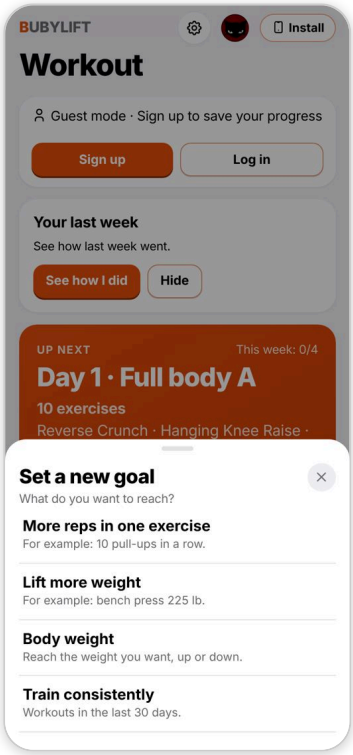

Figure 32. Set a goal

Charts per exercise

Tap an exercise to see how it evolves. You can switch the metric: **Estimated max (1 rep)**, **Top weight**, volume, reps or time, depending on the exercise type. Below you see your best sets and a max calculator.

The estimated max uses the Epley formula and is only a guide: the heaviest weight you could probably lift once, calculated from your sets.

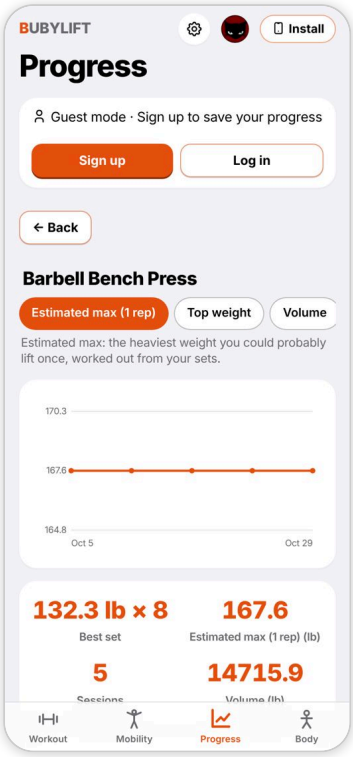

Figure 33. Chart of one exercise

History

Every saved workout, grouped by month, with duration, sets and the main exercises. Workouts with records show a trophy with the number of records. Tap one to see all its details.

Button in the detail	What it does
Repeat workout	Starts again with the same exercises and sets
Save as routine	Turns the workout into a routine
Share	Shares a text summary
Share my workout	Opens the card studio (next section)
Delete	Removes the workout from history

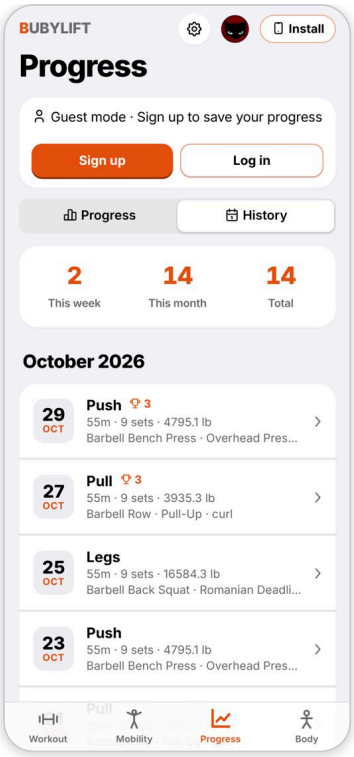

Figure 34. History by month

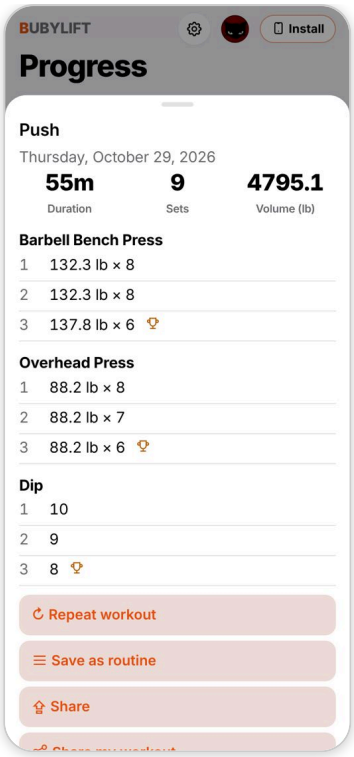

Figure 35. Workout detail

Share card studio

Turn a workout into an image for your stories or posts. There are seven styles: **Classic, Stack, Poster, Chips, Lifts, Badge and Bar**. Choose the background (**Transparent**, your own **Photo** or **Dark**), the size (**Story 9:16** or **Post 4:5**) and the color. Tap **Save image** or **Share**. With a transparent background you can place it over any photo.

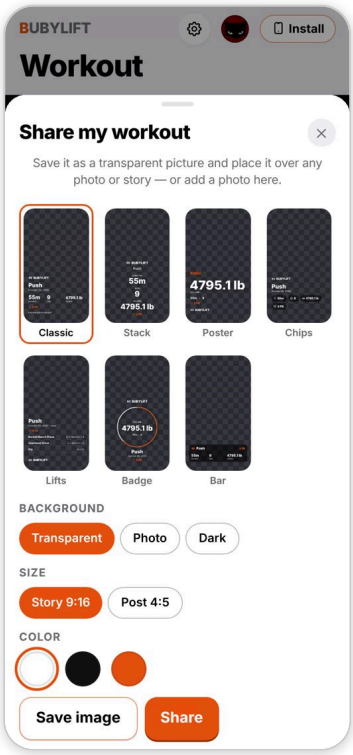

Figure 36. Card studio

10. Body tab

Log your weight, body fat and measurements, and see the trend over time.

1. On the top card, adjust **Today's weight** with − and + (or by tapping the number) and tap **Log my weight**.
2. Open **Date, fat, measurements, note** to add more data or log a past day.
3. Look below: your current weight, the smoothed **trend** and the change **per week**.
4. The chart can be viewed over **1 month, 3 months, 1 year or all**. The dots are your weigh-ins and the line is the trend.

> You can set a target weight; the app calculates progress toward it. It also shows up as a goal in the Progress tab.

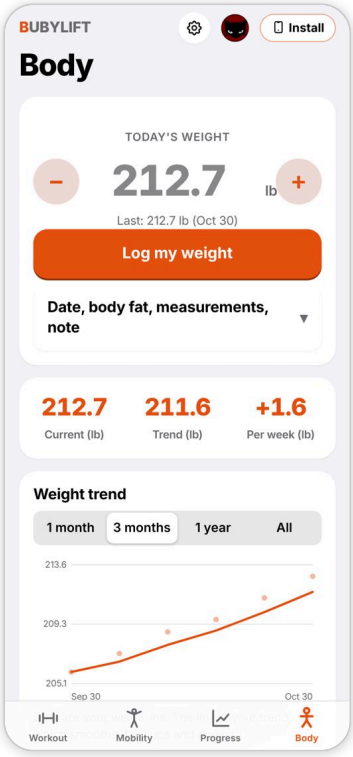

Figure 37. Body tab

11. More: settings, data and help

Tap the **gear** at the top right. The More screen has five parts.

Account

The card at the top shows your status: if you are a guest, the **Sign up** and **Log in** buttons; if you have an account, your e-mail, the sync status and **Manage account**.

Preferences

Setting	Options
Language	English · Español
Text size	A · A+ · A++
Appearance	System · Dark · Light
Units	lb·in·mi · kg·cm·km (your numbers are converted, nothing is lost)
Rest timer	On · Off
Default rest	0:30 to 5:00
Sound and vibration	On · Off
Quick tour	On · Off

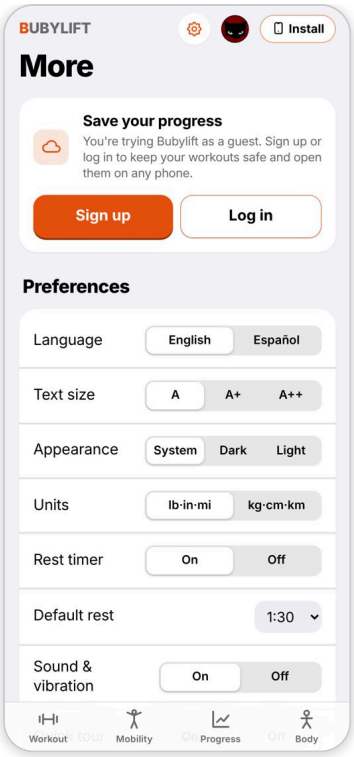

Figure 38. More: account and preferences

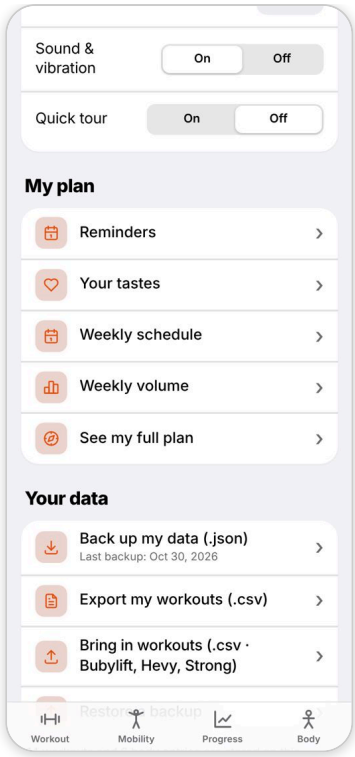

Figure 39. More: my plan and your data

My plan

Appears when you have a plan. See the "Plan tools" section.

Your data

Option	What it does
Back up my data (.json)	Downloads a file with your whole log. Keep it somewhere safe
Export my workouts (.csv)	Downloads your workouts as a spreadsheet
Bring in my workouts (.csv)	Imports workouts from Bubylift, Hevy or Strong
Restore a backup	Loads a .json file you downloaded before

If you have no account, the app reminds you to make a backup with a card on the Workout screen. You can postpone it with **Later**.

App

Option	What it does
Install	Installs the app (if your browser allows it)
Replay the tour	Shows the guided tour again

Option	What it does
What's new	Shows the changes in this version
Help and FAQ	Answers to common questions and a box to send questions or comments
Send feedback	Opens the feedback form
Share the app	Shows a QR code and a link so someone else can open Bubylift
Check for updates	Checks for a new version and shows your version

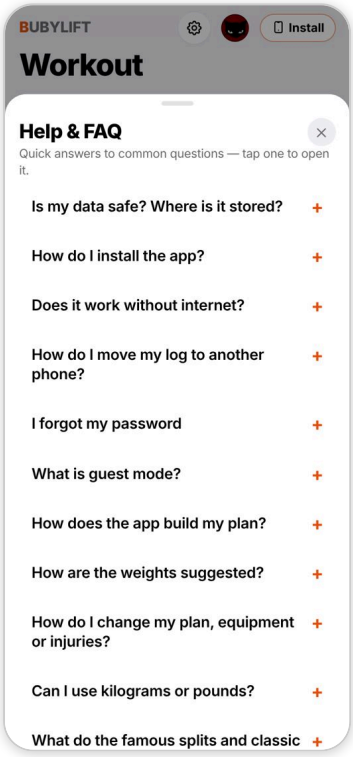

Figure 40. Help and FAQ

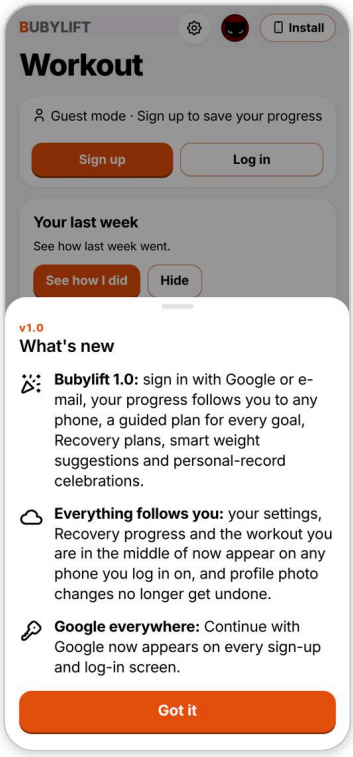

Figure 41. What's new

Figure 42. Share the app

Danger zone

Erase all data deletes everything saved on this phone. It asks for confirmation. If you have an account, its cloud copy is kept until you delete the account from Manage account.

12. Troubleshooting

Problem	What to do
I cannot install the app	Open it in Safari (iPhone) or Chrome (Android), not inside Instagram or another app. Follow the steps in the installation section
The app looks outdated or something fails	Go to More → Check for updates. If it keeps failing, close it completely and reopen it, or write in Help with your phone and browser
I lost my data	Clearing browser data deletes the local copy. If you had an account, log in and your data comes back. If not, restore a backup from More → Restore a backup
I forgot my password	Use "Forgot your password?" and your recovery key. With Google there is no password
I lost my recovery key	You can start fresh with the data on your phone; the cloud copy cannot be opened without the key and the password
"E-mail or password doesn't match" with my Google e-mail	That account was created with Google and has no password. Use Continue with Google
It says "offline" or does not sync	Check your internet. The app keeps working and syncs when the connection returns
My changes do not show on another phone	Wait a few seconds and open the app on the other phone; it syncs on open. Check you use the same account
The timer does not sound on iPhone	Sound is silent if the ringer is off, and iPhone does not allow vibration from the app
Google shows "unverified app"	Tap Advanced and then Go to Bubylift. Only your e-mail and name are requested
The tour does not appear	It is switched off or you already have workouts. Turn it on in More → Preferences or replay it in More → App

13. Glossary

Term	Meaning
Set	A group of reps without stopping
Rep	One full movement
Superset	Two exercises back to back, then rest
Tempo	How fast you lift and lower; for example 4-2-1 is 4 seconds down, 2 paused and 1 up
Phase	A block of about 4 weeks with one focus
Estimated max (1RM)	The heaviest weight you could lift once, guessed from your sets
Failure	The point where you cannot do another rep with good form
AMRAP	As many rounds as possible in a set time
EMOM	Every minute on the minute: you start a task at the beginning of each minute
Volume	Weight × reps added up, or sets per muscle per week
PR / personal record	Your best mark on an exercise
AFT	Army Fitness Test: the U.S. Army physical test
OPT	Optimum Performance Training: NASM's training model

14. Under the hood: code and architecture

This chapter is for anyone who wants to understand how Bubylift is built: developers, reviewers or the simply curious. It is not needed to use the app.

Design principles

- **No build step.** Plain JavaScript, HTML and CSS. It opens in the browser exactly as it sits in the repository; no bundler, no framework.
- **Offline first.** A service worker caches every file; online it goes to the network first, offline it uses the cached copy.
- **Your data is yours.** Everything lives in the phone storage. The cloud is optional and, with e-mail, end-to-end encrypted.
- **Bilingual at the core.** Every string exists in English and Spanish; an automated check fails if a translation is missing.
- **Free hosting.** Published with GitHub Pages from the `main` branch; the optional back end is the Supabase free plan.

Size and stack

Item	Detail
Languages	JavaScript, HTML, CSS; Python only for the check tools
Code	About 11,500 lines across about 40 .js files, plus exercise, guide and text data
UI	Drawn from JavaScript into a single container; custom tabs, bottom sheets and dialogs
Charts	Hand-generated SVG, no libraries
Encryption	Browser Web Crypto API: AES-256-GCM and PBKDF2-SHA256
Cloud (optional)	Supabase: authentication, one table with row-level security and an edge function for Strava
Third-party libraries	qrcode-generator (MIT) and jsQR (Apache-2.0), in lib/
Tests	jsdom smoke test (about 510 checks) and a Python pre-release check; both run on GitHub Actions on every change

Code map

File	Responsibility
index.html	Page structure and script load order
style.css, design.css	Styles, dark and light theme, tablet and desktop layouts
app.js	Core: storage, units, language, theme, install, auto-update, what's new, navigation
workout.js	Workout tab: start chooser, set logging, timer, finish, routines, exercise picker
plan.js, opt.js	Plan engines (classic and NASM OPT model) and famous splits
pers.js, wizard.js	Personalization (injuries, tastes, reasons) and the plan questionnaire
library.js, data/library*.js, data/programs.js	Muscle routines, ranks, timed challenges and classic programs
stretch.js, rehab.js, data/rehab*.js	Mobility and the 13 phased Recovery plans
history.js, goals.js, habit.js, aft.js	History, progress and charts, goals, weekly streak and the AFT test
body.js	Body tab and More screen: export, import, settings
card.js, cardstudio.js	Share cards (canvas) and their studio
cloud.js	Accounts, encryption, sync and change merging
profiles.js	Guest and account profiles, app boot, welcome
tour.js, faq.js, emo.js	Guided tour, help and FAQ, icons
data/exercises*.js, exmeta*, howto*	Library of about 1,000 exercises, metadata and technique guides
data/i18n.js	All interface strings in English and Spanish
sw.js, manifest.json, version.json	Service worker, install as an app and the published version
server/	Supabase schema.sql, Strava function and setup guide
tests/, tools/	Smoke test, pre-release check, icon generator

How the app starts

1. The browser loads `index.html`, which applies the saved theme before drawing anything to avoid a flash.

2. Scripts load in order: cloud config, strings, exercise data, core, tabs and, last, cloud and profiles.
3. `boot()` decides where to go: with a session it enters your account profile; if you came back from Google with no profile it creates one; with no profiles it shows the welcome; with guest profiles it opens the last one.
4. On entering a profile, the app reads its data from local storage, draws the active tab and, for an account, syncs in the background.

Data model

Everything is stored as JSON in `localStorage`, with keys kept separate per profile. The main object holds the following.

Field	Content
workouts	Finished workouts: date, duration, exercises, sets (weight, reps, time, distance)
routines	Saved routines
body	Weight, fat and measurement entries
custom	Custom exercises
plan	Your plan: goal, phase, days, exercises and reasons
goals, aft	Goals and AFT test results
tomb	Deletion markers so deleted items do not reappear on sync
settings	Units, rest, sound, equipment, text size, Recovery progress, workout in progress

Numbers are shown in your units; switching between lb and kg converts what you see and loses no data.

Cloud, encryption and sync

The cloud uses Supabase with a single table, `user_data`: one row per person holding the data, the key vault, a revision number and a timestamp. Row-level security (RLS) means each person can only read, create, change or delete their own row.

Account type	How it is protected
E-mail and password	The phone generates a random data key (AES-256-GCM). That key is stored "wrapped" twice: by the password and by the recovery key (PBKDF2-SHA256). Only ciphertext reaches Supabase; the password it receives is a one-way derivation

Account type	How it is protected
Google	Stored without extra encryption inside the RLS-protected row; no password or recovery key
Guest	Nothing leaves the phone

How sync works. Each change schedules a save after a 2.5-second wait so several changes become one. When syncing, the app downloads the row, merges the changes and uploads the result. Merging is **last change wins**: workouts, routines, goals, settings and the workout in progress carry their own timestamp, and deletions leave a marker so they do not come back.

> The whole cloud row usually weighs between about 300 bytes and 7 KB; the plan is the largest part. That is why sync fits easily in the free plan.

Updates and offline mode

- Each release bumps three numbers together: the cache name in `sw.js`, the version constant in `app.js` and `version.json`.
- Online, the service worker asks the network first, so you always see the latest; offline it uses the saved copy.
- The app compares `version.json` with its own version and, if there is a newer one, updates and shows the what's-new card once.

Testing and quality

- **Pre-release check** (`tools/check.py`): consistent version, strings in both languages, translation keys in use, valid exercises.
- **Smoke test** (`tests/smoke.js`): loads the whole app in jsdom and runs about 510 checks, from building a plan to encryption and sync merging.
- **Continuous integration:** GitHub Actions runs both with `npm test` on every change.
- **Workflow:** each change goes on a branch with a bilingual PR and is merged once continuous integration passes.

How to run the project

There is nothing to install to use it. To develop: clone the repository, run `python3 -m http.server` in its folder and open `http://localhost:8000`. For tests: `npm install` and `npm test`. Cloud accounts are turned on by following `server/README.md`.

Appendix A: Recovery plans

The thirteen plans, each with four phases, a safety check, an evidence summary and sources.

Area	Plan
Foot and ankle	Flat foot and inner-ankle pain
Foot and ankle	Sprained or unstable ankle
Foot and ankle	Achilles tendon pain
Foot and ankle	Heel pain (plantar fasciitis)
Knee and shin	Runner's knee (pain around the kneecap)
Knee and shin	Shin splints (inner shin pain)
Knee and shin	Patellar tendon pain (jumper's knee)
Hip and thigh	Outer hip pain (gluteal tendinopathy)
Hip and thigh	Hamstring strain (pulled hamstring)
Back and neck	Low back pain
Back and neck	Neck pain
Shoulder and arm	Shoulder pain (rotator cuff)
Shoulder and arm	Outer elbow pain (tennis elbow)

Appendix B: Version history

Version	Main change
1.0	Version 1.0: sign in with Google or e-mail, progress on any phone, guided plan, Recovery plans, weight suggestions and record celebrations
0.99.17	Settings, Recovery progress and the workout in progress sync; fixed profile picture changes being undone
0.99.16	Continue with Google on every sign-in screen
0.99.15	Retired the old local password profiles system
0.99.14	Weight suggestion on every exercise, Use button and record celebrations
0.99.13	First-run guided tour and clearer guest mode
0.99.12	Continue with Google
0.99.11	Social-app style login and automatic sync
0.99.10	Clearer buttons; History moves inside Progress (four tabs)
0.99.9	Nine more Recovery plans and an area filter
0.99.8	First Recovery plans

The full log is in the CHANGELOG file of the repository.

Appendix C: Credits, license and contact

- **Author:** Mike, Instagram @bubylifts.
- **Code:** github.com/bubymed/bubylift (source-available, all rights reserved).
- **License:** anyone may use the app for personal, non-commercial use. Copying, modifying, redistributing, hosting or using it commercially requires written permission from the author.
- **Feedback and questions:** More → Help and FAQ, or More → Send feedback.
- **Exercise library:** includes exercises imported from Free Exercise DB and photos from the app.

> ! Bubylift is a logging tool, not medical or coaching advice. Exercise carries risk; use good judgment and ask a professional if unsure.
